Education

Johns Hopkins University - M.S. Robotics and Autonomous Systems: expected Dec. 2025

Notable Coursework: Artificial Intelligence, Reinforcement Learning, Intro to Robotics, Algorithms, Mathematical Methods This is a remote, part-time program designed for students in in-person, full-time roles; I am immediately open to such roles.

Cornell University - B.S. Computer Science, Engineering Physics: graduated May 2023

Notable Coursework: Machine Learning, Robot Learning, Algorithms, Operating Systems, Computer System Organization, Analytical Mechanics, Electrodynamics, Electronic Circuits, Mathematical Methods for Physicists, Experimental Laboratory Served as a Teaching Assistant for: Mechanics and Heat, Electromagnetism, Waves and Quantum Physics, Data Analytics

Experience

Software Engineer - Lockheed Martin | Aug. 2023 - Present

- Investigated, identified, and resolved 12 (and counting) feature and bugfix requests in the Aegis Mission Planner Calculator space, drastically improving plan calculation performance and accuracy of generated metrics.
- Executed build verification, regression, and smoke tests for backend features to identify and correct critical issues.
- Implemented server-side functionality to enable usage of a default radar search algorithm in Java and SQL.

Software Engineer - Cornell Mars Rover, Cornell University | Sept. 2020 - June 2023

- Upgraded the C++ robotic arm controls package from ROS 1 to ROS 2, reimplementing all core functionality and leveraging the MoveIt 2 motion planning library for collision-free path planning and trajectory generation.
- Implemented a control scheme using Forward Kinematics, enabling precise control over individual joint angles.
- Designed and implemented a control scheme using Inverse Kinematics, achieving a >90% reduction in completion time for complicated arm tasks by enabling direct end-effector position and orientation control.

Research Assistant - Cornell University | Sept. 2021 - May 2023

- Developed a computational quantum dynamics model of the diamond Nitrogen-Vacancy center in Python using the QuTiP package. Discovered a ~20% reduction in transition photoluminescence upon driving the defect at resonance.
- Developed upon a 2D two-fluid MHD simulation of an ablating plasma in Fortran 90. Experimented with various magnetic fields and material configurations to produce coherent plasma jets for use in nuclear fusion applications.

Physics Laboratory Technician Intern - Honeywell | June 2021 - Aug. 2021

- Developed an automated tester for Honeywell's ion trap chip, ensuring its electrical properties met all specifications.
- Reduced ion trap chip testing time by >95% via a Python-based electrode capacitance and resistance test suite.

Projects

- **Locomotor-Terrain Interaction Simulation**: I programmed multibody dynamics simulations using Project Chrono in C++ to research animal locomotion in complex terrain with the Terradynamics Lab at Johns Hopkins University.
- ML Classifiers on Iris Dataset: I implemented several machine learning algorithms from scratch, including a Bayes Classifier, a Parzen Window Classifier, a Support Vector Machine, and a Neural Network to classify flowers.
- Aphelion Defense: I led a team of 10 to develop a mobile video game developed in C++, featuring networked multiplayer. As team lead, I proactively fostered a productive and focused team environment, facilitated communication between different sub-teams, and mediated team conflicts and disputes. As a programmer, I implemented unit pathfinding algorithms as well as modular graphics and UI systems. This game is available in beta.
- Flappy Bird AI: I developed a reinforcement learning model to train on Flappy Bird using Python and PyGame. After learning for several hours, the AI achieved a score of over 10,000, an impossible score to achieve for humans.

Skills and Miscellaneous

Skills: Research, Robotics (ROS, MoveIt), Software Development, Computational Modelling, Circuit Design and Analysis, Machine Learning (Pytorch), Programming Languages (Python, C++, Java), Databases (SQL), Version Control (Git), Linux, Unix

Non-Career Interests: Competitive Badminton, Amateur Weightlifting, Strategy Games (Chess, Civilization V, Game Theory)
